

# **Revised Estimated Returns Finishing Yearling Steers**

**January 2014**

Lee L. Schulz, Extension Livestock Economist, Iowa State University

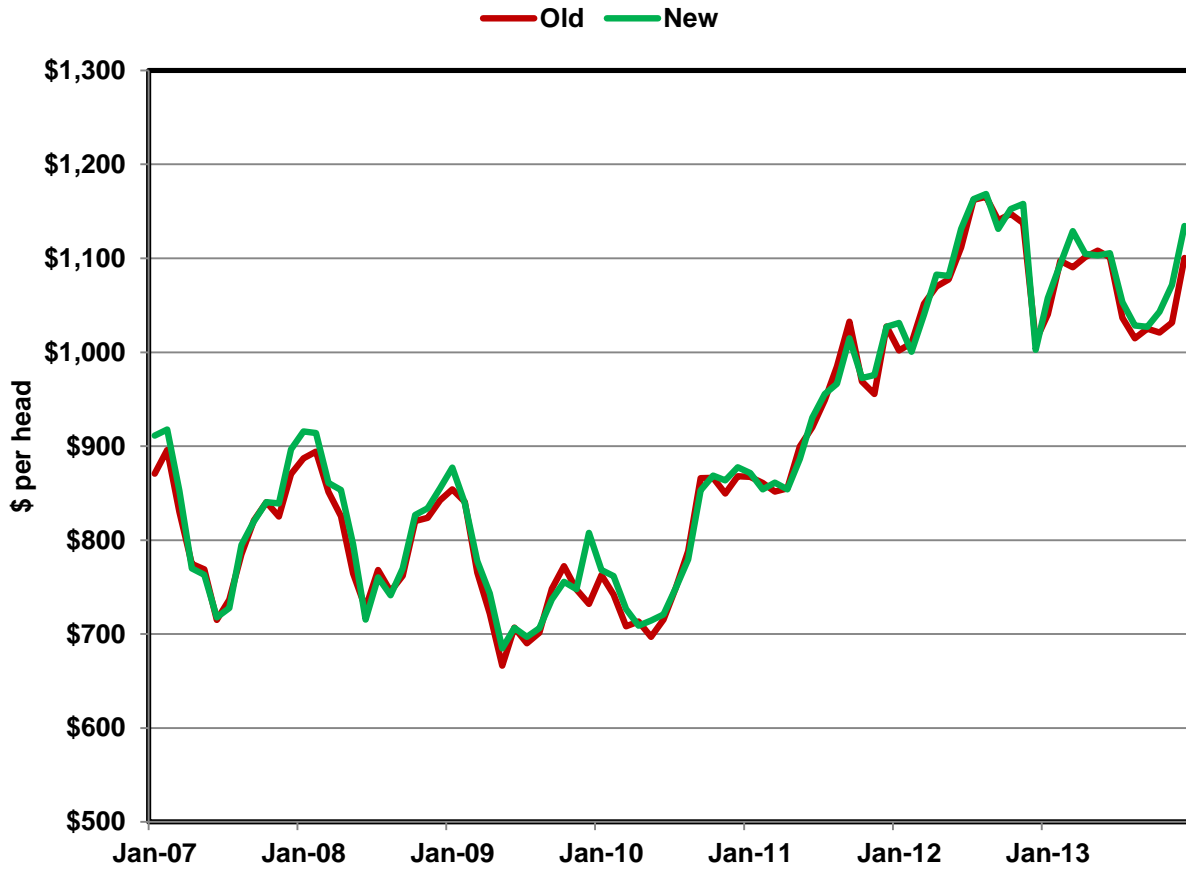

The Economics Department at Iowa State University has prepared monthly Estimated Returns livestock production in Iowa since the 1960s. Each month the costs and returns are calculated based on a set of production assumptions and prices for inputs and outputs that change over time. These returns are not meant to represent any one operation, but rather serve as a barometer of profitability for livestock producers.

Periodically, the procedures are evaluated and revised to more accurately reflect the enterprises we try to represent. The last update was in 2007. We have again updated the procedures beginning with January 2014. The main purpose of this update was to update the productivity, cost, and price procedures using available information. Of particular note, finishing weight was increased from 1,250 pounds to 1,300 pounds to better reflect industry practices. An explanation of how monthly returns are estimated is provided in the Procedures for Estimating Returns.

Given the procedures, standard measures including feed costs, non-feed costs (variable costs, operating interest, and fixed costs), total costs, sales value (gross return), net return, and breakeven values are calculated. These are the main “bottom-line” measures of core interest to most analysts. In addition, with the new procedures a manure credit is included to provide an estimate for the sale of manure (or value captured if used on producer owned land).

The following report provides a comparison of how the updated returns series would have looked over the 2007-2013 period under the new procedures.
